

Any earnings call excerpts or investor reports mentioning AI capex (Big Tech quarterly reports)

Yes. The latest quarterly disclosures show that Big Tech is still increasing AI infrastructure investment, but investor attention is shifting toward **capacity utilization, revenue conversion, component costs and free cash flow**.

Latest quarterly disclosures

Company	Latest quarter	Capex / guidance	AI-related excerpt or disclosure
Microsoft	Q4 FY2026	\$41B quarterly capex; approximately \$190B expected for calendar 2026	Microsoft said capex included the impact of higher component pricing. It also reported that margins were affected by continued investment in AI infrastructure, compute capacity, AI talent and data. [1] [2]
Alphabet / Google	Q2 2026	\$44.9B quarterly capex; \$195–205B full-year 2026 guidance	Alphabet said the “vast majority” of Q2 capex went to technical infrastructure supporting AI. Approximately 60% of technical-infrastructure investment was servers and 40% data centers and networking. [3]
Amazon	Q2 2026	Previously approximately \$200B ; reported investor commentary indicates an increase to approximately \$220B cash capex	Andy Jassy said Amazon expected to invest approximately \$200B in 2026, with the majority supporting AI and AWS, before raising the figure because of higher memory costs. Amazon also said the year-over-year increase in property-and-equipment purchases “primarily reflects investments in artificial intelligence.” [4] [5]
Meta	Q2 2026	\$31.1B quarterly capex; \$130–145B full-year guidance	Meta attributed the spending to servers, data centers and networking, while citing elevated component costs and continued expansion of AI computing capacity. [6] [7]

The four companies are therefore pointing toward roughly **\$735–760B of 2026 capex** at the latest disclosed guidance levels. This is a company-wide figure—not pure AI capex—and includes data centers, servers, networking, leases, conventional cloud infrastructure and other assets.

Notable earnings-call excerpts

Microsoft

Microsoft’s latest results show the tension between AI demand and infrastructure economics:

“Capital expenditures were \$41 billion including the impact from higher component pricing.”

The company also stated that gross-margin pressure was driven by “continued investments in AI infrastructure and growing AI product usage,” while operating expenses rose partly because of compute capacity, AI talent and data investment. ^[1] ^[2]

Investor interpretation: Microsoft is still supply-constrained, but higher capex and component prices are putting pressure on cloud margins before the full revenue benefit of new capacity is realized.

Alphabet

Alphabet provided the clearest breakdown of what its infrastructure spending actually buys:

“CapEx was \$44.9 billion in the second quarter, with the vast majority of the spend in technical infrastructure to support our investments in AI.”

It added that around 60% of technical-infrastructure spending went to servers and 40% to data centers and networking. Alphabet raised its full-year guidance to \$195–205B, citing faster delivery of capacity to meet demand. ^[3]

Investor interpretation: Alphabet is emphasizing that the bottleneck is not only GPUs; server systems, networking and physical data-center capacity are equally important.

Amazon

Amazon’s disclosure links AI capex directly to AWS demand:

“We now believe we will spend approximately \$220 billion in cash capex in 2026,”

with the increase from approximately \$200B attributed partly to higher memory costs. Amazon’s Q2 release separately said the \$66.1B year-over-year increase in property-and-equipment purchases primarily reflected AI investment. ^[4] ^[5]

AWS revenue grew 36.7% year over year in Q2, and Amazon said its AI and chip businesses each exceeded a \$25B annualized revenue run rate. ^[5]

Investor interpretation: Amazon is presenting capex as demand-backed rather than speculative: AWS growth, AI services and custom chips are being used to justify the spending.

Meta

Meta’s Q2 release narrowed full-year capex guidance to \$130–145B, while quarterly capex reached approximately \$31.1B. The company is spending primarily on AI servers, data centers and networking capacity. ^[6] ^[7]

Investor interpretation: Meta is building AI capacity primarily to improve recommendation systems, advertising performance and generative-AI products, but investors remain sensitive to the effect on free cash flow and operating expenses.

Investor-report themes

Across earnings commentary and analyst reports, four themes recur:

- **Demand remains ahead of supply:** Google and Microsoft both describe accelerated capacity delivery and continuing infrastructure constraints.^{[2] [3]}
- **Memory and component costs are rising:** Microsoft, Amazon and Meta have all indicated that higher component costs are affecting capex expectations or margins.^{[1] [4] [6]}
- **Cloud revenue is beginning to validate the buildout:** AWS, Azure and Google Cloud are reporting strong AI-linked demand, but depreciation and power costs arrive before all capacity is fully monetized.
- **The key investor question is payback:** Analysts are increasingly asking whether AI infrastructure produces sufficient incremental cloud revenue, advertising revenue or subscription revenue to justify the unusually high capital intensity.^{[8] [9]}

Slide-ready conclusion

Big Tech's 2026 earnings calls show an AI capex cycle still accelerating: Alphabet raised guidance to \$195–205B, Amazon to approximately \$220B, Microsoft is tracking near \$190B, and Meta expects \$130–145B. The next debate is no longer whether companies will spend, but whether AI revenue growth can outpace depreciation, power, memory and networking costs.

For a presentation, label these figures as “2026 company-wide capex guidance with AI as the primary growth driver,” rather than as direct AI-only expenditure.
