

Recent AI infrastructure investment figures (data center buildouts, chip investments) — e.g., announcements from Microsoft, Google, Meta, Amazon, OpenAI, Nvidia capex numbers

As of 8 August 2026, AI infrastructure investment has moved from individual data-center announcements to a coordinated hyperscaler buildout. The clearest disclosed figures are roughly **\$190–200 billion** each from Microsoft and Amazon, **\$180–190 billion** from Alphabet, and **\$130–145 billion** from Meta in 2026 capital expenditure—though these totals include some non-AI infrastructure, leases, chips, networking and other assets.

Hyperscaler capex

Company	Latest 2026 figure	What it funds	Interpretation
Microsoft	Approximately \$190 billion for calendar 2026	Azure data centers, GPUs/CPUs, networking, finance leases and AI capacity	Microsoft reported \$31.9B capex in Q3 FY2026 and expects quarterly spending to rise above \$40B as new capacity comes online. Roughly \$25B of the annual figure reflects higher component prices. ^[1]
Amazon	Approximately \$200 billion across Amazon in 2026	AWS AI data centers, Trainium/Inferentia chips, networking, robotics, satellites and other infrastructure	Amazon explicitly linked the investment to AI, chips and AWS demand. Its Q2 results said property-and-equipment purchases had risen by \$66.1B year over year, primarily because of AI investment. ^[2] ^[3]
Alphabet / Google	\$180–190 billion in 2026	Data centers, networking, TPUs, servers and Google Cloud AI capacity	Alphabet spent \$35.7B in Q1; about 40% went to data centers and networking. The guidance was raised from \$175–185B, partly because it includes the Intersect acquisition. ^[4]
Meta	\$130–145 billion in 2026	AI-optimized data centers, servers and networking	Meta’s Q2 guidance narrowed to \$130–145B, while Q2 capex reached about \$31.1B. ^[5] ^[6]

Combined headline: These four companies’ current guidance adds up to approximately **\$700–735 billion** of 2026 capex. It should not be described as pure AI spending: company-wide capex includes conventional cloud infrastructure, corporate assets, finance leases, acquisitions and other projects.

Major data-center commitments

- **OpenAI Stargate:** The original Stargate plan targets **\$500 billion** over four years and at least **10 GW** of U.S. AI infrastructure by 2029. OpenAI, Oracle and SoftBank later said announced sites represented more than **\$400 billion** of investment and nearly **7 GW** of planned capacity; subsequent announcements raised the planned portfolio above 8 GW and more than \$450B. ^{[7] [8] [9]}
- **Microsoft Pecos, Texas:** Microsoft announced a new campus adding approximately **2 GW** of capacity, described as a multibillion-dollar investment over five to seven years. ^[10]
- **Meta Lebanon, Indiana:** A new **1 GW** AI data-center campus representing more than **\$10 billion** of investment. ^[11]
- **Meta Alberta, Canada:** A planned **1 GW** AI-optimized data center with investment exceeding **CAD \$13 billion**. ^[12]
- **Meta Louisiana:** Expansion of the Richland Parish campus to **5 GW**, with more than **\$50 billion** of regional investment. ^[13]
- **Meta-Reliance, India:** Meta will lease a new **168 MW** AI-enabled Reliance data center in Jamnagar, with options to scale. The facility is planned to use renewable power and desalinated seawater cooling. ^[14]

Nvidia and chip investment

Nvidia's own capex is much smaller than hyperscaler capex because it is primarily a **chip and systems supplier**, not a major data-center owner.

- **Nvidia fiscal 2026 capex:** Approximately **\$6.1 billion**, up from \$3.4B in fiscal 2025. Its data-center revenue increased 68% year over year, illustrating that Nvidia is monetizing the buildout mainly through GPU, networking and systems sales rather than through its own data-center construction. ^[15]
- **Nvidia-OpenAI partnership:** Nvidia announced an intention to invest up to **\$100 billion** progressively as OpenAI deploys at least **10 GW** of Nvidia systems. However, this was initially a commitment/letter of intent rather than an immediately funded \$100B payment; later reporting indicated that the arrangement had not yet been fully contracted and that the final structure could differ. ^{[16] [17]}
- **Nvidia's role in the cycle:** Nvidia's economic exposure is therefore better represented by GPU and networking revenue, purchase commitments and strategic investments—not by its relatively modest corporate capex.

Useful global benchmark

IDC estimated worldwide AI-infrastructure spending at **\$318 billion** in 2025, more than double 2024's \$153B, with Q4 alone reaching **\$89.9 billion**. This provides context for the scale of 2026 announcements: the four hyperscalers' combined capex guidance alone is more than twice IDC's estimated worldwide AI-infrastructure spending for 2025, although the categories are not perfectly comparable. ^[18]

Presentation takeaway

For a strategy slide, the most defensible framing is:

“Hyperscalers are guiding toward roughly \$700B+ of 2026 capex, while named AI-campus commitments add tens to hundreds of billions more. The bottlenecks are shifting from funding to power, GPUs, advanced packaging, memory, cooling and grid access.”

Use “capex guidance,” “planned investment,” or “investment commitment” rather than “cash already spent,” especially for Stargate and the Nvidia–OpenAI transaction.
